

Case Study

Surveillance system in Commercial Harbors

Date: Mar.' 3' 2017'
No. : EJ201703HC001

Commercial harbors are always busy and full of large container ships waiting for docking and to use their facilities.

To maintain the safety of the harbor and ships, setting up a real-time monitoring system is the most important task.

Formosa Wireless, with years of experience in wireless communication and project planning, set up a wireless surveillance system in a commercial harbor located in middle part of Taiwan to help the traffic control staffs oversee the complete premises and help improving the safety of the harbor.
