

Case Study

City Surveillance in China

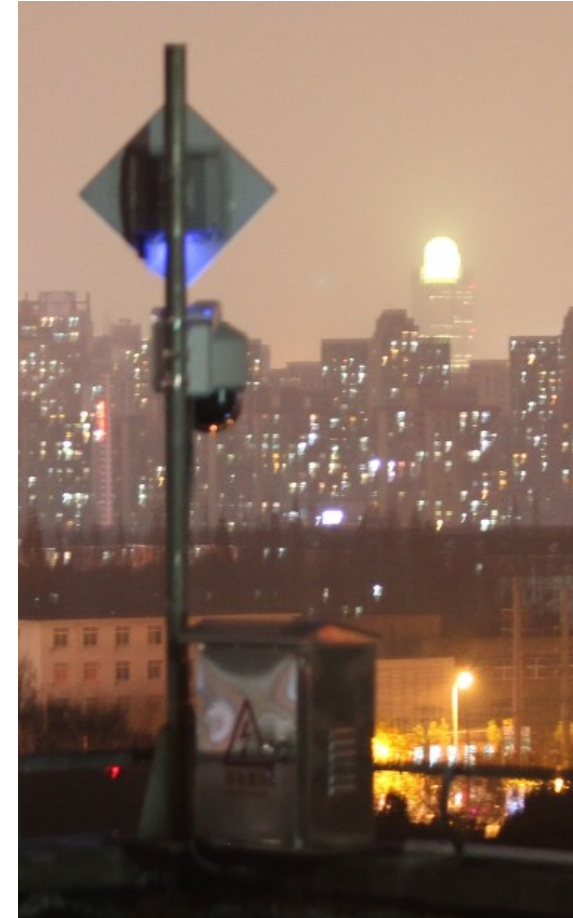

Date: Mar.' 3' 2017'
No. : EJ201703HC003

City security surveillance has always been the priority for the Chinese government to keep their cities safe.

Formosa Wireless Long Range WiTDM microwave solution helped a system provider in China established an urban long range microwave monitoring system.

This system overcomes the obstruction of the surrounding buildings, the interference of radios and successfully established high-resolution signal transmission from speed dome cameras.

We set up a 360-degree monitoring transferring system to send real-time high resolution images to the control center several kilometers away from the highest point.
